1. Your supervisor forwards a rent roll (the list of every unit in a building with its tenant, rent, and lease dates) for a listing under contract and asks for a summary of below-market units by tomorrow. You want to paste it into a free consumer AI tool (a public chat app your firm has not approved). What do you check first?

I wouldn't paste confidential information into a not-approved AI tool because there is serious risk of information getting exposed. I would check in with my superior to find an approved company tool to guide me.

2. You are working from a confidential offering memorandum (a property's sales package and financials) marked "do not distribute." You want help understanding an unfamiliar term in it. Is pasting the sentence containing the term different from pasting the document? Where is the line?

I would paste the term as long as it doesn't share any sensitive property information. I would follow-up with the broker first for better insight to what I'm asking

3. A friend at another brokerage asks how you produced a market summary so quickly. How much do you say?

I would answer honestly but aware of the fact he works at a competing firm. If I used AI tools, I would tell him but don't get into the specifics to protect my firm. I would double check with my boss before sending over.

4. You used AI to draft a tenant email. It came back polished and contains a specific claim about the parking ratio (parking spaces per thousand square feet) that you did not verify. What do you owe the reader before sending it?

First off, I wouldn't send a specific claim without verification. However, I would let them know that you would need to go back and verify but youre giving them a quick answer. I'd ask an analyst to pull up numbers from that specific site.

5. Your firm has no written AI policy. You are asked in an interview whether you use AI at work. What do you say, and what makes that answer safe?

I'd express that I do use AI to streamline my work and use it productively without confidential information. This makes my answer safe because I get work done quicker but also protect confidential information from reaching the web.

6. You are given a spreadsheet of resident names, unit numbers, and payment history to analyze for delinquency patterns. What has to change about the file before any tool sees it?

The file needs to be key protected to prevent outsiders from accessing sensitive information. I'd talk to the IT department before putting any information in to make sure it's protected.

7. An AI tool offers to connect directly to your firm's document storage to answer questions faster. Who has to approve that, and what would you want to know before asking them?

I would ask the IT department about the tool and what it's asking. I would like to know background info on the tool and give me a better understanding of it.

8. You realize a comparable sale the AI cited (a recent sale of a similar property, used to support a value) does not exist, and you had already put it in a draft your supervisor reviewed. What do you do, in what order?

I would immediately alert my supervisor that theres an error. I would then fix the error and send an updated draft over ASAP. I would let him know that an AI tool I used was incorrect and won't make the same mistake going forward.

9. A professor's syllabus prohibits AI on a specific assignment. You have been using it all summer. How do you handle the semester?

I would put the syllabus into AI so it will prevent me from getting answers during the semester. However, I would use it as a tool if I'm confused on questions on an assignment to get clearer answers going forward.

10. You are asked to sign a form saying no confidential data was entered into an unapproved tool. You are not certain about something you did three weeks ago. What now?

I would tell whoever is getting me to sign the form about it and also contact the IT department to go back in my history and find what tool I was using and see if their is anyway to get ride of it.
