1. Steps
   -1. Look through rent roll and get occupancy figured out
   -2. Property manager sends over op statement
   -3. Puts property manager statement into model and compare against budget
   -4. Write down anything more than 5 % off explaining why
   -5. Redo line items to match all expenses
   -4. Boss reviews update and adds a few updates
   -5. Makes the revisions and sent to investors

2. Starting Point
   - Starting point is pulling up rent roll and occupancy. It slips because he spoke about what the property manager sends

3. Maitience expenses are already known

4. Undocumented rules
   - Can't complete much until operating statement is handed over
   - Use template to look over his model
   - Explain if anything within budget is more than 5% off
   - Spoke about categories but don't know what that means

5. Finally, my boss makes revisions and then sends the quarterly update out to investors.

6. - Maintenance accounting team redid all expense categories -> line items didn't match so spent afternoon redoing those
   - Replaced section of roof in march ->repairs and maintenance up 40% which looks bad to investors
   - If someone moves out mid quarter-> Occupancy looks worse

7. He said it takes him 2 days with no clear explanation and right before that it says it takes around 10 business days
8. The steps that should be automated would be rent roll, operating statement and matching expenses with budget because these are all numbers on a sheet that cna explain themselces. The boss reviewing hte final statement should be left with a person because he has seen what investors want to see and the notes section explaining why some expenses are well off because theres many different reasons this could happen. The reader actually values the section explaining if anything is off target. Working through the operaitng statement takes the most time because you have to explain what is happening.
